

ABSTRACT

An image analysis device (100) integratively takes photographs within each well at a predetermined magnification. An image
5 controlling device (200) communicates with the image analysis device (100) via a network (300) for acquiring the taken images and displays the same as thumbnails. On the display of the image controlling device (200), the operator designates locations of the sample to be photographed for each well. The image controlling device (200)
10 informs the image analysis device (100) of the instructions for photographing in accordance with the designated conditions. The image analysis device (100) individually takes photographs in accordance with the locations and conditions designated by the image controlling device (200).
